* **Photoshop Elements:** Adobe has a version of Photoshop specifically for beginning users. While it's not as powerful as the top-tier Photoshop, it's more affordable and is designed to be used on a small screen, such as a tablet computer or smartphone. Elements comes with several basic editing tools, but more advanced features can be purchased as a separate program called Adobe Photoshop Elements. (It's worth noting that this chapter of the book covers only Photoshop CS6, which offers similar features as Elements. If you're using Photoshop Elements, you can skip around to find more information on Elements-specific features.) * **Photoshop for iPad:** You can use a stylus to easily access points on the screen. The latest version of Photoshop now supports better touch capabilities, including tapping, pinching, and swiping. This version allows you to draw, paint, add effects, and more while working on the go. * **Lightroom:** Photoshop is not the only Adobe program for digital photography. Lightroom is a photo-management program that enables you to organize, edit, and share your photos. It enables you to work with images not just in the Camera Raw editor but also in Photoshop after the edit. * **Lightroom Mobile:** Lightroom Mobile is a free version of Lightroom that comes on smartphones and tablets. You can use the mobile version of Lightroom to view and share your images, and to create customized albums and slideshows. Lightroom Mobile supports both RAW and JPEG images. Adobe's latest software includes the popular Photoshop Elements, Lightroom, and Photoshop Creative Cloud—a brand of software that enables you to work on your computer remotely. You can access, use, and edit your files from virtually anywhere. This software provides your desktop, laptop, smartphone, and tablet with access to your files. You can use the Photoshop Creative Cloud feature to access all the tools and features of the software on a variety of your devices. Adobe has several tutorials that walk you through the various features of Photoshop on any device. # POWER USERS' CLOUD: THE ROLODEX CREDENZ Clouding your computer with the top-tier Photoshop program and your other applications isn't a new concept. You can pick up a program that will work similarly to your Photoshop and store your files on a _cloud service_ (also known as an _online storage service_), a server that resides on the Internet.

Q: A term for a penalty as punishment Let's consider a general question: If I ask a kid to do something and he does not do it well, is he punished or punished with a penalty? As you see above, I need a term for penalties, any suggestion? A: I don't think there is an official term for what you are looking for. I would simply call the word "penalty" and explain it. I also suggest that you call it something else, as this whole idea of a penalty is off the mark. Consider another way to ask this question: If the kid did not perform any task well, would it be fair to give him a punishment? I doubt it would be. A punishment is meant to remedy a flawed task. --- title: "Availability Group on a Peer to Peer Network" description: "Read about how the availability group in SQL Server supports the configurable peer-to-peer network in the SQL Server primary replicas." ms.custom: "" ms.date: "10/14/2016" ms.prod: sql ms.prod_service: high-availability ms.reviewer: "" ms.technology: high-availability ms.topic: conceptual helpviewer_keywords: - "Availability Groups, peer-to-peer network" author: CraigMcDejette ms.author: cmcdej manager: dansimp --- # Availability Groups on a Peer-to-Peer Network [!INCLUDE[sqlserver-](../../includes/applies-to-version/sqlserver.md)] Perform an in-place upgrade of the Availability Group in SQL Server to the branch server from the previous major release. To accomplish this, you have to configure the secondary replicas on the Availability Group to be secondary peer-to-peer network nodes. In a SQL Server availability group on a peer-to-peer network, the primary and secondary replica nodes use virtual IP addresses. The replica nodes need to have the same virtual IP address as the primary node. The virtual IP address is that which is used for the replica for TCP/IP communication with the primary node. The secondary replica node has to be configured to have the same virtual IP address as the primary node. The availability group accepts SQL Server transactions from the primary node.
