## NetworkActiv Web Server Free Download For PC

NetworkActiv Web Server Crack + Free

NetworkActiv Web Server is a free, elegant and simple to use web server. It is a very fast system to serve many files and folders at the same time. It is secure as you can

---

restrict access to the server by any IP address, only if the user is registered, with a password or not registered at all. This program is not a download program. You do not install it on your computer. No copy protection, no adverts and no spyware. The program is easy to use, one click to start, no special admin rights required. We

---

recommend that all our users remove any existing web server before using this. You can start the program with your webserver already running or start the program only and let it run in the background. You can even start the program without installing it. The initial setup makes you to set it up manually, so it can be a little confusing. Still it is

---

easy to use and the steps are listed in the manual.

You can access the program in the tray (stays out of the way) and you can make it be a Windows sticky or Task Manager Task. You can make the program to log and send information to a text file on the server. You can also access information such as the day, the date and your IP from which you are

---

trying to access the server.

Configuration: You can do almost anything to the program. Most of the configurable options are listed in the setup wizard. Very basic things such as the setup wizard and what programs can be used as a web server are written in notepad. If you prefer to write the configuration in a program you can write it in any number of languages,

---

such as: □ Inno Setup □  
Autolt □ Visual Basic □  
Delphi □ Notepad □ Other  
You can copy and paste  
the configurations from  
one server to another.

Shortcuts: There are all  
kinds of shortcuts you can  
use. A configurable hotkey  
can be used to start or  
stop the program, or a  
click on the tray icon to  
turn the web server on and  
off, or the task manager to

---

access it. The program has a tray icon and the server can be hidden. The program can be controlled from a web browser.

Windows Description:

Enable the use of your Internet Connection/Access provider. Share files without the need for your clients to download software, as they can simply use their favorite web browser such as Internet Explorer or Mozilla. Serve up web-pages directly from your computer. Can be used to

---

obtain web-pages not available on the Internet. Register Server, Name Server, Port Number, Password and other settings to be stored in an XML configuration file on the clients computer. Extend the functionality of the Web Server and share WebPages and files on Network. Use the Server to transfer web pages from computer to computer (or

---

computer to Internet).  
Simple to setup and easy  
to use. Requirements: □  
Windows 98/ME/NT4/2000/  
XP/Vista/7/8 □ Internet  
Connection □ An Internet  
Browser (such as Internet  
Explorer, Firefox, Opera,  
Mozilla) □ Microsoft  
Internet Explorer 5.01 or  
greater □ Microsoft Outlook  
(for polling). □ The server  
software will not function  
unless it is installed.

---

Instructions: NetworkActiv Web Server is simple to setup and use. Setup the server on the client computer using the built-in Admin GUI (Graphical User Interface). You may be prompted to log on to the server so you can access the settings. You can also go to Settings - Configure Servers - NetworkActiv Server (NetworkActiv Web Server) so you can modify

---

the settings directly, or you can go to Settings - User Accounts so you can add a user. Follow the steps below to get started:

1. Click on Start
2. Click on Run
3. Type: networkactiv
4. Click on OK
5. In the bottom left, right click on server and then select add
6. On the right hand side, enter the following information in each section (in example below we will

---

show it for the first server):  
Server Name:  
(networkserver.local)  
Server Computer Name:  
(cronl) Server's Port  
Number: (8080) Server  
Password: (admin) Allow  
Public Access: (no) 8. Click  
on OK 9. Follow the  
instructions shown when  
you click on OK to modify  
the settings 10. Restart  
your browser. The server is  
configured and you are

---

good to go. You can now use the server to serve web-pages. Go to WebPages - Server -

**What's New in the NetworkActiv Web Server?**

□ Running NetworkActiv Web Server is like having a free file server for home and small office use. □ Files can be viewed directly from your browser (but not uploaded, that's

---

for a later version), or files can be uploaded to the server using web browsers.

- Files on the server can be organized into folders.
- There is a web-based control panel where you can set administrator rights for your files, set the structure of the folders, and see activity information.
- You can create aliases for your server, set the aliases and

---

their relative directories, and choose to auto-  
rename the alias on the fly.

- As you browse the alias, its contents will display in the browser window (see the screenshot).
- You can also browse your server using the control panel.
- A POST (Send) form is included that allows you to upload files to the server from your browser.
- Compression, encryption,

---

and logging of access to files are supported. □

Server performance and memory usage statistics are viewed through a web browser. □ You can set the server to run without installing (nice for when you are using another person's computer). □

Background service settings (even when you log out) allows you to easily add settings and

---

make changes while your computer is on. □ An admin password protects your server. □ You can hide or disable the program icon in the system tray (as you can run your browser as an admin, or an unprivileged user). □ A configurable error/security page for 404 errors and 403 disconnections. □ A configurable cache directory. □ You can

---

associate an alias and folder with a title. This makes it easy to know which folder is which. □ A configurable default font and colour are used for file listings. □ Almost any font can be used. □ Log all user activities to a text file. □ There are few other features not mentioned. This is a demo. Sorry! For now, no 4 way upload. You can see the complete list

---

of features by just clicking the 'What's New' button on the welcome screen. This software is freeware. For full information on "NetworkActiv Web Server" features and user guides, or to report any bugs
