In the Euclidean formalism, however, one has the "bosonized" version (with the boundary potential in the right side of [(\[susy1\])]{}) in which the potential operator is replaced by the "antibosonized" one, which is simply a conjugate of the original one. [^4]: Note that the bosonic expressions [(\[4-1\])]{} and [(\[4-2\])]{} look much simpler than the corresponding fermionic ones. But one should keep in mind that the potential $V({\lambda})$ and the propagator $G({\lambda})$ are, actually, quite complicated functions of ${\lambda}$, which depends on the Lagrangian and the dimensionality of the background space, the most important feature being the "square root" behavior for $V({\lambda})$ and the logarithmic behavior for $G({\lambda})$. Take advantage of new Tabletop Preview to make your design look great on the drawing canvas before it's printed. Easily zoom out to view multiple images or table parts of your drawing all at once. Show new parts and symbols on the design canvas with very compact text, as you would in print, to help you review multiple views of your drawing all at once. Use the live hinge tool to view the hidden parts of your drawings with one click. Assist your design by incorporating CAD layer sets, color themes, and sheet sets into your drawing. The Adaptive Drafting tool now automatically detects when a line, arc, circle, polyline, or text box is disconnected or broken, allowing you to simply place a new line or trace a new arc. AutoIncrement automatically adjusts line widths to accommodate different line widths in a drawing and adapt to any line width set by the user. AutoIncrement saves time by skipping large portions of the process and automatically generates lines as needed.
