2. **The Gradient Tool (G)** lets you paint with color by painting a gradient across the canvas in any direction. 3. **The Paint Bucket (P)** is a tool for applying a wash to an image, by filling it with a color from a palette. 4. **The Lasso tool (L)** lets you click on an area of an image and specify a bounding box that it must fit into. Photoshop then automatically selects and shows the contents of the box as a selection. 5. **The Pencil Tool (L)** lets you apply various kinds of pressure to change the color of selected pixels. 5. **In the upper-left portion of the Options bar (L)**, click the first drop-down menu, labeled Pen Tool. It's a menu of various pen types, and the main settings are explained next. **You can choose from the following seven settings, all of which are explained on the next page:** 1. **Paint Bucket**. This setting indicates the color that will be painted into your selection. (The color you select will be shown as a dotted rectangle around the selection.) 2. **Brush**. You can choose from a variety of sizes of brushes. 3. **Soft Round**. This setting turns the brush into a round soft round brush. You can set the number of round pixels that are used. 4. **Soft Round Brush**. This setting allows you to set the roundness of the pixels you will use in your brush. 5. **Number of live pixels**. This setting indicates how many pixels you want to create in your brush. 6. **Airbrush**. This setting allows you to create a background color for your selection. 7. **Brush Pressure**. This setting determines the pressure you want to apply to the brush when you create a new selection. You can choose from "hard" or "soft," which makes the brush easier or harder to push. These are all very straightforward settings, but it's worth taking a closer look at each. For example, the Airbrush tool works by taking a reference color and using it to set a new color. You can use the settings in Table 2-6 for

### What's New in the?

Q: **c#** create an instance of an abstract base class and use it i have a base class and i need to create an instance of the derived class based on another instance of that base class. the problem is that the base class is abstract so i can't just create a new class and inherit it from that one. i need to modify a member of the abstract class from another instance of the base class (the object that called a method in that member). these are the class definitions: 

```
public abstract class DeviceBase { public string Model { get; set; } protected void ErrorHandler(string error) { try { Console.WriteLine(error); } catch { } } } public class Device : DeviceBase { public DateTime Date { get; set; } public Device(string model) : base(model) { //i need to call a method in base class from the current instance of the derived class ErrorHandler("whatever happens"); Date = DateTime.Now; } } this is the calling code: Device d1 = new Device(""); d1.ErrorHandler("whatever"); Console.WriteLine(d1.Date); so the instance of Device needs to call the member function from the instance of DeviceBase. please don't tell me to use interfaces for such a case, i already have interfaces which are derived from DeviceBase and this is only because the base class needs to be abstract. thanks in advance A: You can make the method protected, or add the override keyword. 

```
public abstract class DeviceBase { public string Model { get; set; } protected void ErrorHandler(string error) { try { Console.WriteLine(error);
```
