Thank you, that is just exactly what I was looking for! A: Thanks for writing. Unfortunately, I cannot think of a way to exclude a directory in your search, if you are looking for the exact filename. However, you can get around this by first renaming the file and then running a rename command: rename's/V1.\$/' file.txt This finds all the lines that start with "V1.", removes the "V1." from the start of the line and leaves the rest of the line as-is. Hope this helps, Best, Chris The US government on Thursday (11 November) suspended the Global Magnitsky Act - a law under which certain Russian officials can be sanctioned by the US if they are accused of gross human rights violations. The move means US President Donald Trump can no longer sign an executive order creating special sanctions against Russian government officials under the law. But the White House can still issue its own version of the order through regulation. It comes a week after Congress suspended the Russia sanctions bill, which is effectively the principal vehicle for the Magnitsky Act, over fears it could be a way to punish Trump's chief political opponent, Hillary Clinton, for her role in the 2016 election. What is the Magnitsky Act? In August 2016, Congress passed the Magnitsky Act - named after Browder and a Russian accountant who died in prison in 2009 - and signed it into law. The law allows for the US to impose financial sanctions against officials accused of committing human rights abuses. It was named after Browder, who lost huge sums in a tax scheme and fled Russia. It has also made several former associates of Russian President Vladimir Putin 'persona non grata' in the US. A US citizen who spent time in Russian prisons on charges he denies has also been named a target of the law. Browder and his lawyer, Natalia Veselnitskaya, alleged a senior Kremlin official had organised a tax fraud scheme in which Browder was involved, and which cost him millions of dollars. Browder met Donald Trump Jr

The most common alloys are chromium-bearing alloys such as stainless steel, low alloy steel, nickel-chromium alloys, and certain types of high-temperature alloys. The reduction of chromium-bearing alloys during processing or in the environment is often desirable. This reduction is typically carried out with carbonaceous reducing agents such as alkali metal- or alkaline earth metal-carbon monoxide. In addition to chromium, the carbonaceous reducing agent also contains carbon which combines with the chromium. More recently, dicarbonyl compounds, such as the beta-diketones (O. J. Thomas, C. Y. Chang, and P. J. Vaidya, Aust. J. Chem., 30 (11):1167-74 (1977)), have been used as the reducing agent. A double bond in the dicarbonyl compound is believed to play an important role in the reduction of chromium-bearing alloys. Electrodes have been used which contain an electrochemically active polymeric material, such as polystyrene (R. R. Rue, M. L. Blaha, and J. S. M. Cluimer, J. Electrochem. Soc.: Solid State Science and Technology, 118(7):467-71 (1981)) or a conducting polymeric material, such as polyvinylpyridine (V. S. Karpov, K. V. Kornilova, and V. V. Ursic, Materials, 3(1):16-21 (1991)) or polyaniline (O. Takay 6d1f23a050
