the dod already uses a wide variety of software licensed under the gpl. a 2003 mitre study, use of free and open source software (foss) in the u.s. department of defense, identified many oss programs that

the dod is already using that are licensed under the gpl. these included the linux kernel, the gcc compilation suite (including the gnat ada compiler), the openoffice.org office suite, the emacs text editor, the nmap network scanner, openssh and openssh for encryption, and samba for unix/linux/windows interoperability. this should not be surprising; the dod uses oss extensively, and the gpl is the most popular oss license. total cost-of-ownership is always important to consider when selecting a license. the conclusion is often that the cost of the license has little effect on how the software is used. there are often commercial alternatives that will do everything the license-restricted software can do at a lower price (and may use the

proprietary software for things it cannot do), and often the same software is available under multiple licenses. when licenses are restricted, the software is usually bundled with the license (as is often the case with proprietary software licenses), which means there is a non-zero transaction cost for the user to obtain it. however, this cost is usually either small, or is made up for by lower user costs (licensing is often relatively straightforward). in the case of gpl software, the gnu general public license stipulates that the software must be completely free; this means that when a piece of software is obtained under gpl, it is obtained free of charge.

the academia sinica institute of bioinformatics (asib) is a bioinformatics research institute based at the institute of biochemistry and molecular biology at the national academy of sciences in taipei, taiwan. it was founded in 1993 to build taiwan's infrastructure for bioinformatics.

free & open source software. foss as defined by the free software foundation is an alternative approach to software development that produces programs and related documentation as free software. source code, documentation, and freedom are the three major goals of free software.

any user who obtains a copy of the software, therefore, possesses the freedoms described in the license. the free software

foundation promotes the development and use of free software by licensing free software under terms that guarantee users all three freedoms. they say: "these freedoms guarantee users all the rights they need to share and enjoy free software regardless of who produces it." no. the gplv3 is the most recent version of the gnu gpl version 3. gnu provides the complete set of the gnu software tools under the gpl and gnu general public license. gnu is well-suited for programming because of the absence of restrictions, and because it permits use of source code to create proprietary works that otherwise would not be possible. both foss and gnu/gpl are licenses that are used to license the software that is produced. for the purposes

of this video the only important difference is that the foss style does not require that the source code be available to the public. foss style does not require that the source code be made public if there are parts that are not source. what is required is that people can inspect the source code, and be aware of the structure of the source code, in a word, understand it. gnu/gpl require that the source code is made public. 5ec8ef588b
