KeyMACRO (key management software) is an advanced security application for both single-user and group-based protection of data. It offers data encryption, file shredding, password protection, data storage, online backup and remote access, as well as printing and email capabilities. KeyMACRO is the brainchild of a developer with a background in computer networking and programming, and a graduate of the University of Wroclaw, who was frustrated by the lack of a program that made it possible to securely share data between multiple users or computers. KeyMACRO is based on its own cryptographic protocol, of which the only components are the kernel and the public and private keys that are used in cryptography to encrypt and decrypt information. The kernel is a modular open-

source component that can be easily integrated into other software applications and combined with the public and private keys stored on your hard drive. To make it even more secure, the secret keys are used to encrypt and decrypt information and the data is stored on an entirely different partition, thus preventing the content of one key from being accessible by another application. In addition to the aforementioned features, KeyMACRO also comes with some other handy functions such as a program that allows you to recover lost files and a file shredder, as well as a web-based control panel that enables you to remotely access and control your encrypted files. A couple of months ago I published a post reviewing a similar piece of software called Web Key Manager. Now that the article has been published, I figured I'd continue the reviews by publishing a similar review of KeyMACRO. The bottom line: KeyMACRO is an advanced security software application for both single-user and group-based protection of data. Support for multiple user accounts, including one master account and multiple user accounts Strong encryption with AES-256 and SHA-256 User-friendly interface, which supports both Windows and Mac OSX Remote access via Internet or VPN
