In this episode we're putting the Raspberry Pi Zero W out of its box and dive right into some of the basics of the latest, greatest single-board computer. For those not familiar with the Pi, it's a very small, inexpensive computer that's powered by Linux and has a pretty slick GUI and is all open source. It's used in all sorts of projects

from robots to cameras to being a good general-purpose PC for many of us. It's also inexpensive, something that's not the case for most high-end computers. In this video we're going to be taking a first look at the Zero W, we're going to be putting it together, and then we're going to talk about what it has to offer. Then we're going to move on to talking about some of the great projects we've seen recently. We're starting with a video on the shipping of the new Pi Zero W. Let's Get Started! The Raspberry Pi Zero W is a very small computer based on the

Raspberry Pi Zero. It shares many of the same core components, and all the same features, as the Raspberry Pi Zero. The new device also contains a built-in Wi-Fi adapter, as well as a USB-C connector for external peripherals. The Zero W also includes a MicroSD card, as well as an on-board power supply, and speaker. The board's dimensions are roughly the same as that of the Raspberry Pi Zero, however, the Zero W is slightly thicker. As with the Zero and other Raspberry Pi boards, the Pi Zero W is soldered onto a small printed circuit board,

which plugs into the Raspberry Pi Zero's 40-pin GPIO header. The Raspberry Pi Zero W comes in several variants: base models, with either 4 or 8GB of RAM, and with either 32GB or 64GB of eMMC, as well as a model with 32GB of RAM and no eMMC. The Ultimate Privacy YouTube Alternatives is a listing of
