Sharks Sharks are marine animals with two dorsal fins, a tail fin, five gill slits, and pectoral and pelvic fins. Sharks can have a variety of colors, including white, gray, black, brown, yellow, and red. Shark attacks may result in damage to the fish they are feeding on, or to the shark itself. Although shark bites are relatively rare, they are extremely dangerous. According to a study in the Journal of the Royal Society of Medicine, the mean duration of hospitalization for a shark bite is five days and that many bite victims will develop tetanus.[1] Other statistics indicate that shark bites are more common during warmer months, the time of year when sharks are most active. Thus, according to the CDC, even a single bite by a shark of any species is considered to be a medical emergency.[1] Mating behavior varies among different species of sharks. All sharks have multiple sexual partners. Some sharks use various forms of camouflage to hide in the water, and once their camouflage fails, a shark may use its mouth to distract and entice a potential mate. Shark mating behavior is rarely documented because sharks are commonly hunted, killed or otherwise consumed. However, in a number of cases, such as the sperm whale, the act of mating appears to involve a very slow and gentle rubbing of the two sides of the sperm whale's head.[]

Q: User profile image I have a recent update to happen to my site as well as my database on the server. As such, I need to change my users' profile images, username, email addresses, and so forth. What is the best way to do this? A: Coding it in SQL (on table creation) would be my preference. But, there are plenty of UI

customizations for this; you could get away with just the UI. I'd generally "pre-declare" my changes for an update and then apply them, so there isn't a mess of comma's everywhere.

```
INSERT INTO users
```

```
(userID,firstName,lastName,userPhoto,userEmail,userBio) VALUES ('1234', 'Bobby', 'Bob', '123456789.jpg', 'test@test.com', 'This is me!');
```

1. Field of the Invention The present invention relates to a shift register and, more particularly, to a shift register for

liquid crystal display (LCD). 2.

Description of Related Art In general, for a liquid crystal display (LCD), as shown in FIG. 1, a shift register 10 comprises a plurality of shift register units 11 serially arranged in a first direction. Each shift register unit 11 comprises a pull-up transistor 111, a pull-down transistor 112, a pull-up control transistor 113, and a pull-down control transistor 114. The pull-up transistor 111 is used to pull up a transmission line COM<sub>n</sub> for n-bit data.

The pull-down transistor 112 is used to pull down a transmission line COM<sub>n</sub> for n-bit data, and has a third gate terminal and a fifth gate terminal. The pull-up control transistor 113 has a first gate terminal connected to the third gate terminal of the pull-down transistor 112 and a second gate terminal connected to a power source VDD. The pull-down control transistor 114 has a third gate terminal connected to the third gate terminal of the pull-down transistor 112, and a

fifth gate terminal connected to the power source VDD. In the conventional technique, the pull-up transistor 111 and the pull-down transistor 112 are MOS transistors, which have the same channel area, and an electrostatic discharge (ESD) gate structure is provided between the first gate terminal of the pull-down transistor 112 and the third gate terminal of the pull-up 79a2804d6b
