This is a great new feature. Create a document and save it as a Web Page. You can then access that in any browser. It displays at the correct resolution without enlarging the file. There is an option to screen shot it or hit cancel. It's slick, but its launch was a bit awkward. The Brush Tool is amazing. The brushes are literally everywhere on the screen. You can use the Pen Tool, Layer Styles, Gradient Tools, or any combination to simulate anything you can imagine. It's the best tool to start with, or the best tool to fine-tune anything you've already done. If you've never used Photoshop, this is a great way to get a feel for what image editing is about. From here, you can move to the Adobe CC subscription and then to the full version of Photoshop. With the new Artboard feature, you can create a large area to be able to work on, but you can always go back and place your art at any part of the canvas. It's a great way to organize your art and will always remember where it is on the screen (unlike in the full version, where the art appears "somewhere in the file"). While performing an edit, if you click where you want to place an image, there is an option to "Create in Flow Chart." This creates the image on another layer that is imported from the DNG image and becomes, essentially, another layer in the stack of any layers selected on the canvas. It is a simple way to separate images in the stack and works for groups of photos. From here you can continue with that edit.
