Photoshop also features a new Content-Aware Fill option that helps generate the missing content in an image. You can use this new feature to fill out a negative space in an image. In addition to content-aware fill, you can also copy and paste layers into each other to instantly join them into a

new one. Better selections can also be made by using the new Content-Aware selection tool, which evenly colors the area around the selection so that components of similar color are included. The new Edit invert option can also invert a selection to change its color and extrude it. The new Content-Aware Move tool lets you move regions of the image without losing the rest of the image. Another aspect of the new Photoshop release that you will love is the new blending options available in the blending menus. The new Blend Options tab allows you to adjust each included layer's blend weight, transparency level and channels, and paint mode. For example, a task such as merging images with different tonalities can be done with a bit of preset adjustment. All this functionality is available without the need for custom blend layers. A workflow update developed within the state-of-the-art studios at Adobe, Adobe Media Encoder 4.0 (AMA4) is the first release to leverage the newly created tonal engine technology that contains all of the tools for merging, compositing, and color correction. AMA4 now supports all popular video and still file formats as well as even Adobe ProRes codecs. As we saw in our annual testing of mobile apps, when the original source file formats fall away, the industry needs new tools.
